

## 1. Early technology adoption

Introduction of GIS, centralised traffic monitoring and RFID data collection, laying the foundations for a digital infrastructure.

## 2. Technology and infrastructure development

Deployment of smart networks (3G, 4G), IoT and big data for intelligent mobility and urban management to increase efficiency and improve service delivery.

## 3. Cloud computing and IoT sensors

Focus on centralised processing on the cloud and advances in IoT-based sensors.

## 4. Integrated analytics systems

Development of integrated networks and incorporation of AI-driven and advanced data-driven GIS analytics.

## 6. Human-centric urban service shift

Embrace citizen-centred approaches that prioritise human well-being and societal needs, focusing on sustainability, resiliency and equity.

## 5. Technological threshold

Use of AI and cognitive computing for autonomous management, increasing efficiency while raising privacy and human control concerns.
